Hubble.md

The best notepad for you and your agents. Free, open source, backed by Markdown and HTML.

[Download](#) · [Releases](#) · [Contributing](#) · [@bholmesdev](#)

What is Hubble?

Hubble is a free, open-source notetaking app for you and your agents.

- **Feels familiar.** The same writing experience you're used to from Notion or Apple Notes, but for Markdown. / commands, Markdown shortcuts, and file properties / frontmatter are supported.
- **Agent ready.** Point your agent at your notes folder to start collaborating. Hubble will live-reloads as your agent edits.
- **Build any view.** Beyond Markdown, you can build and view HTML-based apps. [Install the skills](#) and tell your coding agent what to build. Turn a folder of notes into a table, a bookshelf, a map... anything you can think of.

Download

Hubble ships as a desktop app. Install the latest build from the [releases page](#).

macOS, Windows, and Linux are supported. macOS builds are signed and notarized; Windows and Linux builds are unsigned, so your OS may warn before the first launch.

Compile from source

Want to build Hubble directly? First, install the prerequisites:

- [Node.js](#)
- [pnpm](#)
- macOS desktop builds: Xcode Command Line Tools via `xcode-select --install`

Then from the repo root:

```
pnpm install
pnpm bundle:desktop:mac
# or for windows:
pnpm bundle:desktop:win
# or for linux:
pnpm bundle:desktop:linux
```

This creates a production desktop bundle under `apps/desktop/release/`. For the live dev flow and packaging detail, see [apps/desktop/README.md](#).

Repository structure

This repo is a pnpm workspace:

```
.
├── apps
│   ├── desktop # Electron desktop app (the main Hubble app)
│   ├── web     # Astro landing page (hubble.md homepage)
│   └── www     # React + Convex web app (Hubble in the browser.
HEAVILY WIP)
├── packages
│   ├── editor      # Framework-agnostic Markdown editor core
(Tiptap + Markdown conversion)
│   └── ui          # Shared React editor UI built on the editor
core
│   ├── runtime     # Runtime injected into HTML Apps and Embeds
│   ├── sync        # Filesystem sync engine (HEAVILY WIP)
│   ├── convex-client # Convex client used by the sync engine
│   └── sync-backend # Convex backend powering Cloud Sync
```

└─ cli
terminal

`hubble` CLI for syncing a folder from the

Common commands

From the repo root:

```
pnpm install          # install dependencies
pnpm dev:desktop      # run the desktop app in dev
pnpm dev:www          # run the web app in dev
pnpm build            # check, build all packages, and typecheck
pnpm bundle:desktop:mac # build a production desktop bundle for macOS
pnpm check            # run Biome
pnpm typecheck        # typecheck all packages
```

Documentation

- [CONTRIBUTING.md](#) covers the contribution flow, local setup, and pre-PR checks.
- [CONTEXT.md](#) is the shared glossary for project terms (Workspace, HTML App, Embed, and more).
- [apps/desktop/README.md](#) covers desktop build, dev, and packaging.

Contributing

Contributions of any size are welcome. Open an issue before substantial work so we can agree on the approach together. See [CONTRIBUTING.md](#) for the full flow.

This project follows our [Code of Conduct](#). To report a security issue, see our [security policy](#).
